ADD INSIGHT TO YOUR HMIS

When you're dealing with big data, you need the right tool for the job. ClientInsight is a data warehouse and community intelligence platform architected from the ground up to ingest, cleanse, parse, and analyze big data from virtually limitless numbers of sources, and features built-in Power BI, which allows you to apply the power of enterprise business intelligence to community care coordination and homeless services. ClientInsight ingests data from your existing HMIS, enabling you to turbo-power it into the next stage in HMIS case management evolution.

An HMIS is an indispensable tool in the work of ending homelessness. But due to its inherent limitations, many agencies are stuck in a cycle of reactive work, putting out fires and reacting to crises rather than addressing the core issues causing them. ClientInsight is Eccovia's solution to this problem, empowering agencies to break the cycle of reaction and start preventing crises before they happen. And, most importantly, ClientInsight accomplishes all of this and more, all without replacing your existing HMIS.

WHAT DOES CLIENTINSIGHT PROVIDE?

(that an HMIS can't on its own)

A single HMIS database. A state often has multiple CoCs, which can include a wide variety of service providers, data sources, and different HMIS software. ClientInsight is vendor agnostic, and there is virtually no limit to the number of HMIS data sources it can ingest. Beyond HMIS, ClientInsight can ingest data from any data source.

1.

2.

AI-driven, probabilistic client matching. Using the power of AI and machine learning, you can easily train ClientInsight to match duplicate records automatically with up to near 100% accuracy. Together with its customizable data ingestion pipeline and built-in data cleansing tools, ClientInsight can save you countless hours of exhausting, tedious work and yield a cleaner database.

De-identified data for anonymized reporting. ClientInsight allows you to maintain the highest levels of HIPAA security and VOCA/VAWA privacy compliance without sacrificing the details essential to reporting.

3.

Data optimized for analytics. ClientInsight's architecture is subject-oriented rapidly providing the necessary data required for decision-making based on the search topic. To perform the same operations with an HMIS would take much longer and noticeably slow down the HMIS system and its users.

4.

5.

Integrated Power BI. With built-in Microsoft Power BI, ClientInsight allows you to parse and visualize your data to uncover trends, patterns, and stories over your entire database; and build detailed dashboards. ClientInsight augments your existing HMIS by bringing the power of business intelligence to community care coordination and homeless management.
